Amdt. Dated February 13, 2006

Reply to Office Action of Dec. 2, 2005

Amendments to the Claims:

This listing of claims will replace all prior versions, and listings, of claims in the application:

Listing of Claims

1. (Currently amended) A reversible ratchet-type wrench comprising:

a handle having a head extended from the handle and a web between said handle and the head; wherein the head has a hole in communication with a cavity in the web;

a compartment disposed in the web and having a first end in communication with the cavity and a second end in communication with an outside surface of the web; wherein-a bridge-is maintained-in-the-web-between-the-hole and-said compartment;

a drive member rotatably mounted in the hole of the head, said drive member including a plurality of teeth formed on an outer periphery thereof;

a <u>sliding</u> pawl mounted in the cavity and including a first side with a plurality of ratchet teeth and a second side with a recess;

a switch member including a turn-piece for manual operation and an actuating plate extended from the turn-piece and rotatably pivotably received in the second end of said compartment, wherein the actuating plate has a receptacle facing the recess in said pawl, said switch member being movable between two positions for sliding said pawl between a first location and a second location so as to change ratcheting direction of the drive member;

a biasing means engaged between the receptacle in said switch member and the recess in said pawl, said biasing means adapted operable to urge the ratchet teeth of said pawl into engagement with the teeth of said drive member; and

wherein said switch member has a first position where, upon counterclockwise rotation of said handle, said pawl engages a first portion of a wall defining said cavity and said drive member so as to prevent relative rotation between said drive member and said handle, and upon clockwise rotation of said handle, said pawl disengages said drive member and compresses said biasing means in a manner that changes the location of the center of said pawl relative to said drive member urges said switching member to the first position.

2. (Currently amended) The wrench of claim 1 wherein said switch member has a second position whereupon clockwise rotation of said handle, said pawl engages a second portion of a wall

Amdt. Dated February 13, 2006

Reply to Office Action of Dec. 2, 2005

defining said cavity and said drive member so as to prevent relative rotation between said drive

member and said handle, and upon counterclockwise rotation of said handle, said pawl disengages

said drive member and compresses said biasing means in a manner that changes the location of the

center of said pawl relative to said drive member urges said switching member to the second

position.

3.-4. (Cancelled)

5. (Original) The wrench of claim 1 wherein said biasing means comprises an elongate

member and an elastic member.

6. (Original) The wrench of claim 5 wherein the elastic member is at least partially disposed

within the elongate member.

7. (Currently amended) The wrench of claim 5 wherein the elongate member has a first end

adapted to engage engaged with the recess in said pawl and a second end adapted to engage

engaged with the receptacle in said switch member, wherein said pawl is adapted operable to rotate

about the first end of said elongate member.

8. (Currently amended) The wrench of claim 1 wherein the second side of said pawl is

curved and is adapted operable to engage a curved wall of said cavity.

9. (Currently amended) A reversible ratcheting mechanism comprising:

a housing having an upper face and a lower face with a circular hole extending from the

upper face through the lower face, a circular compartment extending from the upper face, and a

cavity connecting the circular compartment to the circular hole; wherein [[the]] a central axis of the

circular hole is parallel to [[the]] a central axis of the circular compartment;

a drive member rotatably mounted in the circular hole, said drive member including a

plurality of teeth formed on an outer periphery thereof;

Amdt. Dated February 13, 2006

Reply to Office Action of Dec. 2, 2005

a sliding pawl mounted in the cavity, said sliding pawl including a first side with a plurality

of ratchet teeth and a second side with a recess, wherein the recess has a first end and a second end;

a switch member including a turn-piece for manual operation and an actuating plate

extended from the turn-piece and rotatably received in the compartment, wherein the actuating

plate has a receptacle facing the recess in said pawl;

a biasing means having an elongate member, with a first end extending into the cavity and

engaging the recess of said pawl and a second end disposed within the receptacle of said switch

member, and an elastic member adapted operable to urge the elongate member into the recess of

said pawl such that the ratchet teeth of said pawl engage the teeth of said drive member;

said switch member being rotatably switchable between a first position and a second

position for sliding said pawl between a first location and a second location so as to change ratcheting

direction of the drive member; wherein the first position has a clockwise ratcheting direction and a

counterclockwise free rotation direction and the second position has a counterclockwise ratcheting

direction and a clockwise free rotation direction; and

said switch member being movable between two positions

wherein when the pawl is in the first location, the center of the pawl is located in a different

location than the center of the pawl when the pawl is located in the second location, and wherein

counterclockwise free rotation biases said switch member to the first position and clockwise free

rotation biases said switch member to the second position.

10. (Original) The mechanism of claim 9 wherein said switch member has a second position

whereupon clockwise rotation of said handle, said pawl engages said cavity and said drive member

so as to prevent relative rotation between said drive member and said handle, and upon

counterclockwise rotation of said handle, said pawl disengages said drive member and compresses

said biasing means in a manner that urges said switching member to the second position.

11.-12. (Cancelled)

13. (Original) The mechanism of claim 9 wherein said biasing means comprises an elongate

member and an elastic member.

Amdt. Dated February 13, 2006

Reply to Office Action of Dec. 2, 2005

14. (Original) The mechanism of claim 13 wherein the elastic member is at least partially

disposed within the elongate member.

15. (Currently amended) The mechanism of claim 13 wherein the elongate member has a first

end adapted operable to engage the recess in said pawl and a second end adapted operable to

engage the receptacle in said switch member, wherein said pawl is adapted operable to rotate about

the first end of said elongate member.

16. (Currently amended) The mechanism of claim 9 wherein the second side of said pawl is

curved and is adapted operable to engage a curved wall of said cavity.
